Title: State Diagram for Online Food Delivery System

Introduction

A State Diagram is a type of UML behavioral diagram used to represent the different states of an object and the changes that occur from one state to another during its lifecycle. It shows how an object responds to different events and how its state changes based on those events.

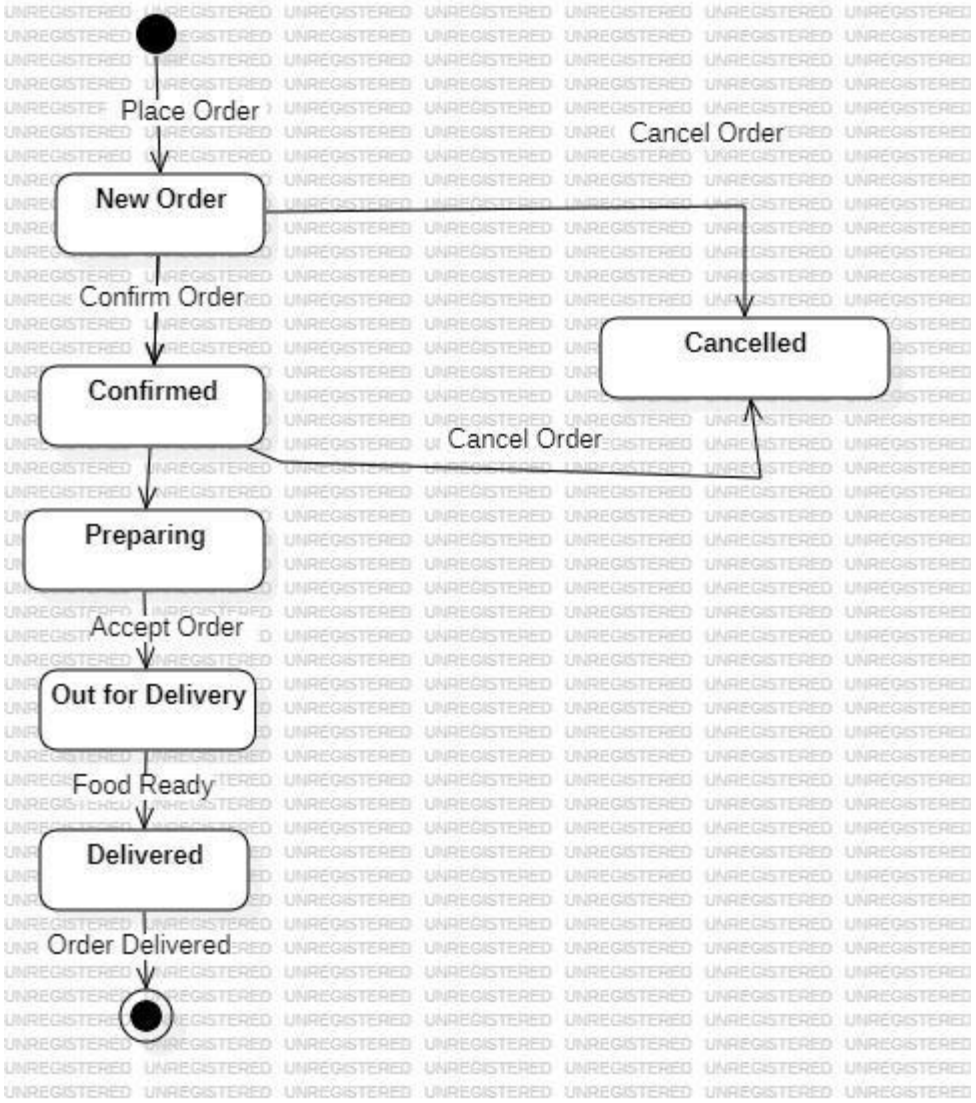

In an Online Food Delivery System, an order passes through several states from the time it is placed by the customer until it is delivered or cancelled. The State Diagram helps in understanding the complete lifecycle of an order in the system.

Purpose of the State Diagram

The main purpose of the State Diagram is to represent the dynamic behavior of an object. It shows:

- Different states of an object.
- Events that cause a change in state.
- Transitions between different states.
- Initial and final states of the system.

For the Online Food Delivery System, the **Order** is considered as the main object because its status changes continuously during the food ordering and delivery process.

Place Order
New Order
Cancel Order
Confirm Order
Cancelled
Confirmed
Cancel Order
Preparing
Accept Order
Out for Delivery
Food Ready
Delivered
Order Delivered

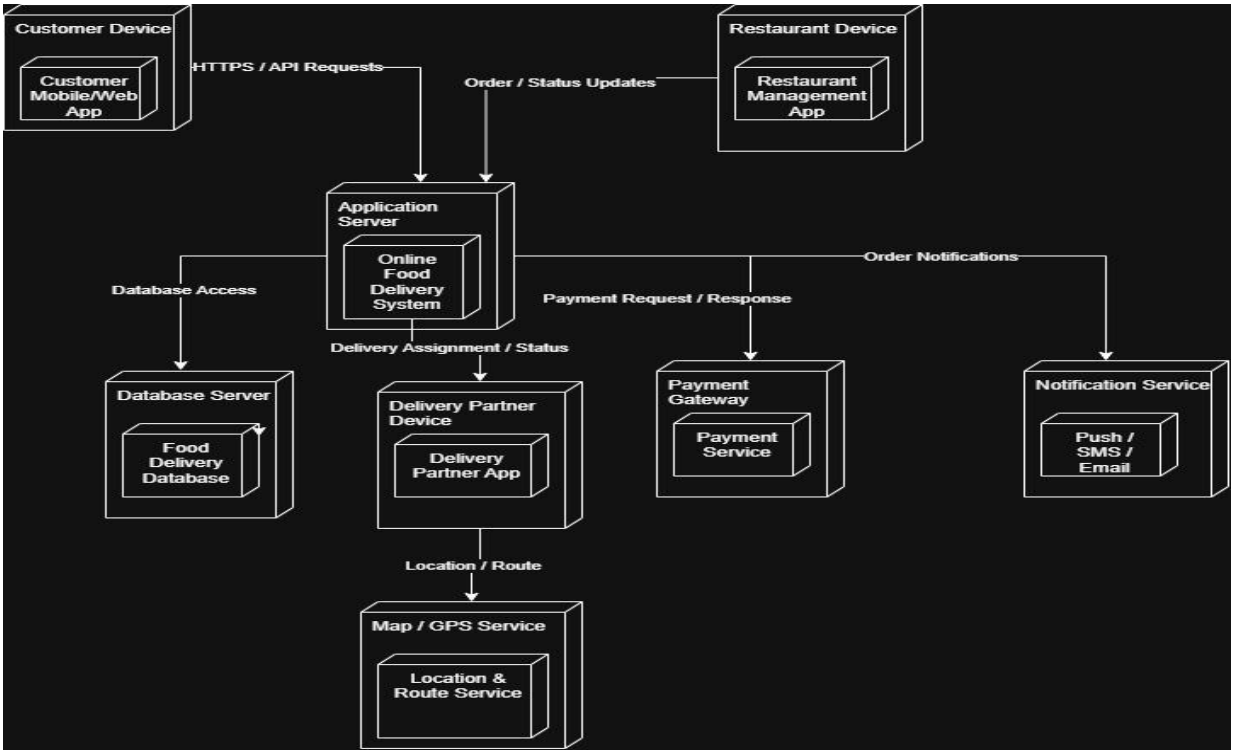

DEPLOYMENT DIAGRAM

Deployment Diagram – Online Food Delivery System

A **Deployment Diagram** is a UML diagram that shows the **physical arrangement of hardware and software** used to run a system. It shows where the application, database, and other components are deployed and how they communicate with each other.

For your **Online Food Delivery System**, you can make a simple deployment diagram with:

- **Customer Device**
- **Internet**
- **Application/Web Server**
- **Database Server**
- **Restaurant Device**
- **Delivery Partner Device**

Component Diagram – Online Food Delivery System

A **Component Diagram** is a UML diagram that shows the **main software components/modules of a system and how they are connected**.

For your **Online Food Delivery System**, keep it simple and college-level. We can use these components:

1. **Customer App**
2. **Restaurant Management**
3. **Order Management**
4. **Payment Management**
5. **Delivery Management**
6. **Authentication**
7. **Database**
8.
