Sequence Diagram

A **Sequence Diagram** is a UML diagram used to show how different users, objects, or components of a system interact with each other in a particular sequence. It represents the **order of messages exchanged over time** to complete a specific task.

In an **Online Food Delivery System**, a sequence diagram can show interactions such as customer login, placing an order, making payment, and tracking delivery. It helps in understanding the step-by-step flow of a process and the communication between the customer, system, restaurant, database, and delivery partner.
